Release Notes

Insights Release 2023.09.01

Build: 0.2023.8.4825

Release Notes

The Janison Insights Release **2023.09.01** includes bug fixes, improvements and new features.

Bug fixes

People

- When configuring Author user role permissions, admins found that when setting the permission for Admin Delete to 'Deny', Admin Delete would still be visible and actionable for the user role and access to Deep Copy to Discipline functionality has been removed instead. A fix was implemented to ensure the correct permissions are being applied when configuring Admin Delete access. This issue is resolved.

- Users found they were unable to switch roles when an extra role/s were added to or already included in their main role, the user had the ability to select the "OK" button to confirm but the switch would not be acknowledged by the system. A fix was implemented to ensure users can successfully switch roles, even when extra roles are included. This issue is resolved. (90085)

- Unprompted changes to role permissions and configurations were being seen intermittently causing various issues for customers, particularly after a new deployment. However, the investigation found no evidence to support deployments were responsible for altering role permissions and instead the primary issue was determined to be the changing of workflow definition > configurable workflow security actions. To better detect any similar changes in future, extra logging and a 'Recent Activities' expandable has been added to the workflow definition.

Delivery

- When attempting to action a deep copy of a certain test, it would also create a copy of the other tests with similar sections. A fix was implemented to ensure the deep copy functionality works as expected and no longer creates duplicates of other tests. This issue is resolved. (90076)

- When reviewing a candidate's attempt using the Test Attempt Information modal, users found that the 'Saved' and 'Size' data was not being displayed for File Upload questions even though the question had been answered and uploaded successfully by the candidate. A fix was implemented to ensure 'Saved' and 'Size' data is now being displayed. File Upload is currently supported for SQL delivery only. This issue is resolved. (89776)

- When attempting to preview and/or print blueprint tests, it was found that images included in these tests were not being displayed in the print preview template. A fix was implemented to ensure images are displaying as expected. This issue is resolved. (77868)

Improvements and new features

Authoring

- By enabling the "Enable Code Editing" setting, available on the Extended Text item type, allows candidates to answer this item type as a code language specific response. The Rich Text Editor will be overridden and will only display line numbers to the candidate when taking their test. This setting can be used when creating both existing and new Extended Text items in Insights.

Reporting

- An improvement was made for users to only be able to access assessment events if the assessment event falls within their scope. Once a user has scope over an assessment event, they are then able to select their own Organisation and Organisation Unit in both Guttman and Question Summary report filter pages to successfully generate a report.
