API Release Notes

Events API Version 11

Release Notes

Please ensure to update your environments to the newest API version available to use the latest

API features.

Platform

- We have enhanced the Events Core API so integrated systems can surface student break usage on test attempts. Previously, break time consumed and whether a break was active at closure could not be consistently retrieved via the attempt's endpoints or customisable reports. With this update, a new v11 Events Core API extends the existing `/attempts` and `/attempts/{attemptId}` endpoints to expose the new "BreakTimeUsed" and "StartBreakTime" properties and updates the related customisable reports to include these fields. (JIRA: INS-11256)
- We have enhanced the Insights Events PNP APIs so integrated systems can configure and manage Student Break settings consistently. Previously, Student Break properties were not exposed via the PNP endpoints, limiting how break time could be created, updated or read. With this update, a new Events v11 API extends the GET, POST and PATCH `/pnp` endpoints to include "breakTimeConfiguration", "breakTimeInMinutes" and "maxBreakTimeInMinutes", enabling reliable storage and retrieval of Student Break configuration. (JIRA: INS-11249)
